

Systems integration is an ongoing challenge for document scanning operations.

**SoftTrac® PostScan** provides a solution to this problem.

Based on ibml's extensive expertise in moving data from our native database to any number of backend systems, we have developed customized exporters that support a wide range of systems, including:

- Data entry/automated data capture systems
- Enterprise content management (ECM) solutions
- Image and data archives
- Workflow/business process automation systems

#### How It Works

SoftTrac PostScan uses an DSN connection to communicate with a multiple SoftTrac-populated SQL database. This allows the application to quickly and easily retrieve images from one or more image repositories. Providing an even smoother integration, standardized "connectors" allow users to configure ibml batches to be inserted directly into the Kofax Capture and TIS eFlow platforms.

#### Standard Features

- Ability to combine groups of documents into non-searchable PDF files
- Ability to combine groups of documents into a single multi-page TIFF file
- Automated document re-orientation
- Overlay of a virtual endorsement on a page
- XML output
- Image output based on color detection

#### Optional Features

- PDF search and compression capabilities
- Connector to Kofax capture system
- Connector to TIS eFlow platform
- Tools that allow users to create their own connector between ibml and their backend system

For complex applications, ibml also offers custom development. Custom developed features may include file creation, virtual batching to route documents or groups of documents, and much more.

#### Let's Get Started

ibml brings together a powerful portfolio of hardware, software and services to deliver document scanning solutions that enable efficiencies and cost-savings for improved business performance and productivity.
